The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, disostured (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoistic disorders, neural disorders (e.g. Alzheimer's, haematopoistic syndrome, Jacob disease, encephalomyalitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a method for reducing proliferation of or extracellular matrix production by a cell in a mammal. The method comprises administering to the mammal a composition comprising a therapeutically effective amount of a zvegf4 antagonist chosen from activation, and mitogenically inactive, receptor-binding variants of zvegf4. Zvegf4 (also called PDGF-D) is a multi-domain protein that is structurally related to placelet derived growth factor (PDGF) and vascular endothelial growth factors (VEGF). Zvegf4 has cytostatic, nephrotropic, hepatotropic, antifilammatory, osteopathic and antiarthritic activities. The method is useful for reducing proliferation of mesangial, epithelial, endothelial, smooth muscle, fibroblast,

                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated protein comprising a first polypeptide disulphide-bonded to a second polypeptide. The first and second polypeptides are from 113-138 amino acid residues and comprises 258-370 amino acid residues of human growth factor homologue ZVEGF4. The protein stimulates proliferation, differentiation, or migration of protein stimulates proliferation, differentiation, or migration of semaphorins. ZVEGF4 may be used to design ant/agonists of neuropilinsemaphorins interactions which may be of use in neurite growth, cardiovascular development, cartilage and limb development, —— and B-cell functions as well as treating rheumacion, retinopathies, haemangiomas, cardiovascular development, cartilage and limb development, —— and B-cell functions as well as treating rheumacion, retinopathies, haemangiomas, system diseases and peripheral nervous system diseases including stroke. The isolated protein is also used for a pharmaceutical composition as therapeutic agents, diagnostic agents, and research tools and reagents. It can be used in the study and regulation of cell and tissues to control organ development by modulatingers that act on tissues to control organ development by modulating cross the located on chromosome 11q22.3 cormetabolism. The gene for human ZVEGF4

ò 유 ò

The present invention relates to the isolation of a growth factor homologue referred to as zvegf3, and the polynucleotide sequence encoding it. The zvegf3 polypeptide is useful for stimulating the growth of fibroblasts or smooth muscle cells, or for activating the growth of platelet-derived growth factor (PDGF) alpha receptor. The zvegf3 coll-surface polypeptide is useful as a PDGF alpha receptor agonist and thus is useful cor treating full-thickness skin wounds, female reproductive tract and duodenal ulcers. The polypeptide is also useful fer an additive in tissue adhesives for promoting revascularisation of healing tissue. The zvegf3 polypeptide is also useful for treating liver damage including damage due congestion (CPC), central hemorrhagic necrosis, hepatic chronic passive congestion (CPC), central hemorrhagic necrosis, hepatic chronic passive congestion (CPC), central hemorrhagic necrosis, cardiac sclerosis, and many types of thrombosis, portal vein thrombosis, cardiac sclerosis, and many types of cirrhosis. The polypeptide is useful for enhancing expansion and mobilisation of endothelial precursor stem cells. Creating and circhemia, organ transplants, wound healing, and circhemia is useful for treating peripheral neuropathies by increasing spinal cord and sensory neurite outgrowths consequence treatment for the regeneration of neurite outgrowths consequence treatment for the regeneration of neurite outgrowths consed by spinal injuries. Application may also be made in treating neurodegenerative diseases (e.g. multiple sclerosis, Alzheimer's disease, (clinopathy, psoriasis, and paralysis caused by spinal injuries. Application may also be made in treating consequence of the readence of sclerosis, and glomerulosclerosis, Alzheimer's diseases (e.g. multiple sclerosis, Alzheimer's diseases (e.g. multiple sclerosis, Alzheimer's diseases (e.g. multiple sclerosis, Alzheimer's diseases) and plantal provascularisation the merovascularisation that provascularisation that provascularisation, and provascularisation, psoriasis, cancer, impaired or excessive vasculogenesis or angiogenesis, and diseases of the nervous system. The present sequence represents human

A; Map position: 8p21-8p21

A; Map position: Qualizes hydrolysis of the carboxyl-terminal propeptide of collagen type C; Function:

A; Description: Catalyzes hydrolysis of the carboxyl-terminal propeptide of collagen type C; Superfamily: procollagen C-endopeptidase; astacin homology; Clr/Cls repeat homology; E C; Keywords: alternative splicing; beta-hydroxyasparagine; bone; calcium; duplication; gl f; 1-22/Opmain: signal sequence #scatus predicted <SIG>
F; 33-822/Product: procollagen C-endopeptidase splice form HIS #status predicted <MAT>
F; 130-321/Domain: astacin homology <AST>
F; 32-491/Domain: Clr/Cls repeat homology <Clr?>
F; 551-594/Domain: Clr/Cls repeat homology <Clr?>
F; 551-587/Domain: Clr/Cls repeat homology <Clr?>
F; 591-700/Domain: Clr/Cls repeat homology <Clr?>
F; 91,142,332,363,599/Binding site: carbohydrate (Asn) (covalent) #status predicted
F; 114,Active site: Glu #status predicted
